

## roll cutting & conversion

conversion of mill rolls to requisite sizes

**Filterserve is the premier independent  
supplier of filtration in the UK.**

**We are specialists in producing filtering  
media to specific sizes.**

**This process ranges from the cutting of rolls  
of material into smaller rolls or sheets and the  
manufacture of active carbon filter elements.**

## sheet cutting

We can cut filter media into sheets that are used for a number of applications, the biggest being the filtration of cooking fats. We are able to produce a slab of media up to 2.2 metres wide and with a length of 3.2 metres. We have the ability to cut holes into the sheets at any required position. In addition to hole cutting we can also cut the media into any particular shape you require.

## roll converting

We can convert filter rolls to your individual specifications. The maximum converted roll width is 2.16 metres, however any roll length can be produced. The final length is usually determined by the space the you have where the roll is loaded into your machine. We can roll the media onto any of 3 different diameter cores - 58mm, 70mm and 76mm inside diameter.

When the roll is run to the required length it is wrapped immediately to ensure that the media is kept clean. Roll converted media produced by us is used mainly by the food industry. It is also used to filter machine coolant by manufacturing and engineering industries.

## air filter media sheet cutting

This media is used in spray booths, cooking filters and air intakes for rooms where clean air is preferred. This media is widely supplied throughout the industry in rolls that are 2 metres wide with a roll length of 20 metres.

We have the facility to cut this media down to your specified sizes. This can help you if you do not wish to purchase a full roll. We can usually cut and despatch any order received by the next day.
